

Alesis CF1 Combo Pedal Board

Expression plug is ¼" TRS balanced connected to the pedal - I use this for the expression jack on the Fusion.

For what it's worth I set my ohm meter to the 200k scale and connected it to the expression plug points shown in the schematic and it reads 46k ohms.

The plug marked down is standard ¼" plug connected to a momentary switch - I use this for the sustain jack on the Fusion

The plug marked up is standard ¼" plug connected to a momentary switch – I use this for the sustain jack on the Fusion

The Alesis manual does not say squat about what works and what does not work.

Note that your pedals and/or switches need to be plugged into the Fusion before turning the Fusion on. The Fusion checks the connections when you power it up.
